

The JumpBox library contains more than fifty-five different applications spanning all major product categories. It is the world's most complete selection of "ready to use" Open Source server software and now you can have this installed on your VPS servers in India provided by WIPL

Evaluate applications on Virtual Machines without investing hours of your time.

The initial process of investigating an application to see if it does what you want can consume hours of your time. With JumpBox you can try any of over fifty different Open Source applications in minutes.

A consistent management experience regardless of the underlying technology.

Regardless of whether it's a Python, PHP, Perl, Ruby on Rails, .NET or Java application under the hood, you manage it the same way. Each JumpBox includes a GUI management interface called the "admin portal" that allows you to perform the most common administrative tasks. Change the host name, configure email relaying, enable SSH/SFTP, install an SSL certificate, turn on stats or configure automated backups. The tools are identical across the entire library so once you've managed one you know how to manage them all.

Deploy as many applications as you need

If yours is the typical IT shop you have more problems than solutions. Sometimes problems demand a complex integrated system but other times you just need a simple solution for a particular task. With JumpBox you have access to a broad array of software all in a consistent format and available at a simple and inexpensive monthly price. You don't have to worry about

getting purchasing approval for each application. Like that trusty toolkit in your garage JumpBox is the go-to resource for addressing many challenges.

Breath easy while trying to upgrade your VPS in India or anywhere

Open Source applications are notorious for breaking themselves on upgrade. With the prevalence of version-specific plugins, code customizations and general absence of sufficient documentation, it's no wonder admins get anxiety when it's time to upgrade to a new version.

Our upgrade process ensures you have a working instance of the application at all times. Rather than modifying your live production instance you download a fresh copy of the most current JumpBox and use our migration mechanism to populate it with your data. When you're satisfied that the migration was successful simply cut over your DNS and point users to the new instance.

Where can I find more information about Jumpbox & what applications can it deploy ?

JumpBox can deploy over 55 ready to use applications like Jasper Business Server, Drupal, Redmine Project Management, OpenVPN networking, Magento, Wordpress & even Nagios, this is a very small list of the application JumBox can deploy, for more details on it you can visit <http://www.jumpbox.com/library>

Excellent ! I'm impressed, how can I setup and start going ?

We are currently testing Jumpbox integration on our ordering form, till then you can start enquiring about it by sending a mail to sales@wipl.in
